DATA SHEET

N4917BACA Optical Receiver Stress Test Solution 100 Gb/s Ethernet

25GBASE-LR/-ER/-SR, 100BASE-LR4/-ER4/-SR4 and MSAs

Complete optical receiver stress test solution for 100GbE optical transceivers with automated stress eye calibration and performance compliance testing

Optical Receiver Stress Test for 100GBASE-LR4/ER4/SR4 and MSAs

In recent years, transmission speeds in gigabit ethernet have continuously increased from 10 Gb/s to 40 Gb/s and are now reaching the 100 Gb/s speed class. 10 Gb/s Ethernet was designed based on a 10.3125 Gb/s line rate on one single-mode fiber per direction. The 40 Gb/s Ethernet speed class changed this to an architecture using the same 10.3125 Gb/s line rate but using four optical wavelengths in the O-Band on one single-mode fiber per direction. This increased the transmission capacity by a factor of four, without a need to make changes to the speed of the electrical components. In the last few years the 100 Gb/s speed class has been established, increasing the electrical line rate from 10.3125 Gb/s to 25.78125 Gb/s. It also uses both four optical wavelengths on one fiber as well as multiple fibers with one optical wavelength per fiber. The conformance test specification for 100 Gb/s transmission speed class is defined in the IEEE 802.3 standard, clause 88 for 100 Gb/s Ethernet long reach (LR4) and extended reach (ER4) and clause 95 for 100 Gb/s Ethernet short reach (SR4). The N4917B optical receiver stress test solution provides an automated stressed receiver sensitivity test in accordance with the 100GBASE-LR4, ER4 and SR4 test specifications as well as with the following 100G Multi Source Agreements: CLR4, CWDM4, 4WDM.

KEYSIGHT TECHNOLOGIES

To do this kind of test, several test instruments such as a bit error ratio tester, digital sampling oscilloscope, optical reference transmitter and tunable laser source are required to operate together to achieve a compliant, repeatable optical stressed eye. This stressed eye is then fed to the receiver under test, where bit error ratio is measured under the stress conditions as defined in the standard.

The N4917BACA solution provides:

- Automated calibration of the optical stressed eye according to IEEE 802.3 clause 88 and 95 and related MSAs
- Calibration of ER, VECP/SEC, J2, J4, J9, OMA parameters
- Repeatable results
- Adjustable target values for ER, VECP/SEC, J2, J4, J9, OMA
- Jitter tolerance compliance and margin test
- Electrical loop back or optional DUT control interface for full automated JTOL test
- Remote control of all the test instrumentation

For this, the N4917BACA includes the following key equipment:

- A high-performance bit-error-rate tester
- An optical reference transmitter for 25.78125 Gb/s
- A tunable laser covering the O-band for LR4/ER4 or an 850 nm laser for SR4

This equipment is fully compatible with the N4917BACA 400G Optical Receiver Stress Test solution.

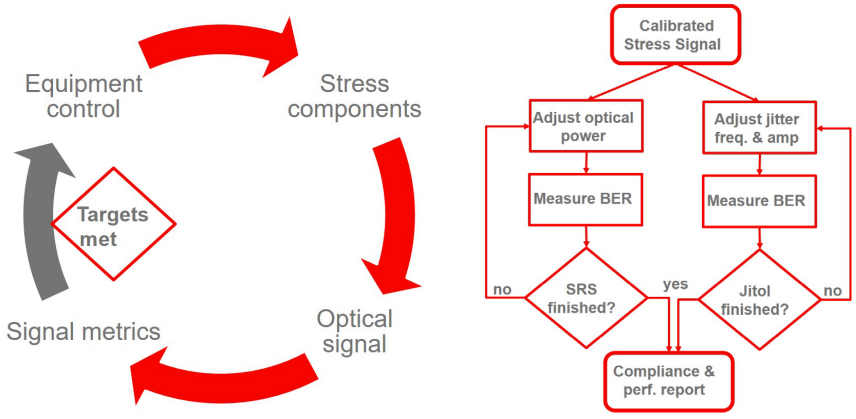

Figure 1. Calibration process and performance test steps as carried out by the N4917BACA software.

Typical Setup for 100GBASE-LR4/-ER4 Optical Stress Test

The N4917BACA optical receiver stress test solution consists of a M8040A BERT for electrical signal generation plus an arbitrary waveform generator or a pulse signal generator for stress generation; an electro-optical converter that modulates the optical signal and a digital sampling oscilloscope which is required for calibration of the stressed eye.

An example setup for 100GBASE-LR4/-ER4 using four 25 Gb/s lanes on four wavelengths in the O-band is shown in Figure 2, which assumes the use of a 100 GAUI-4 electrical interface. The IEEE 802.3ba standard establishes two ways to provide a clock signal to the digital sampling oscilloscope:

1. Using the 'clean clock' of the pattern generator or
2. Extracting it from the stressed signal using an external clock recovery.

Refer to the configuration guide section for the detailed setup.

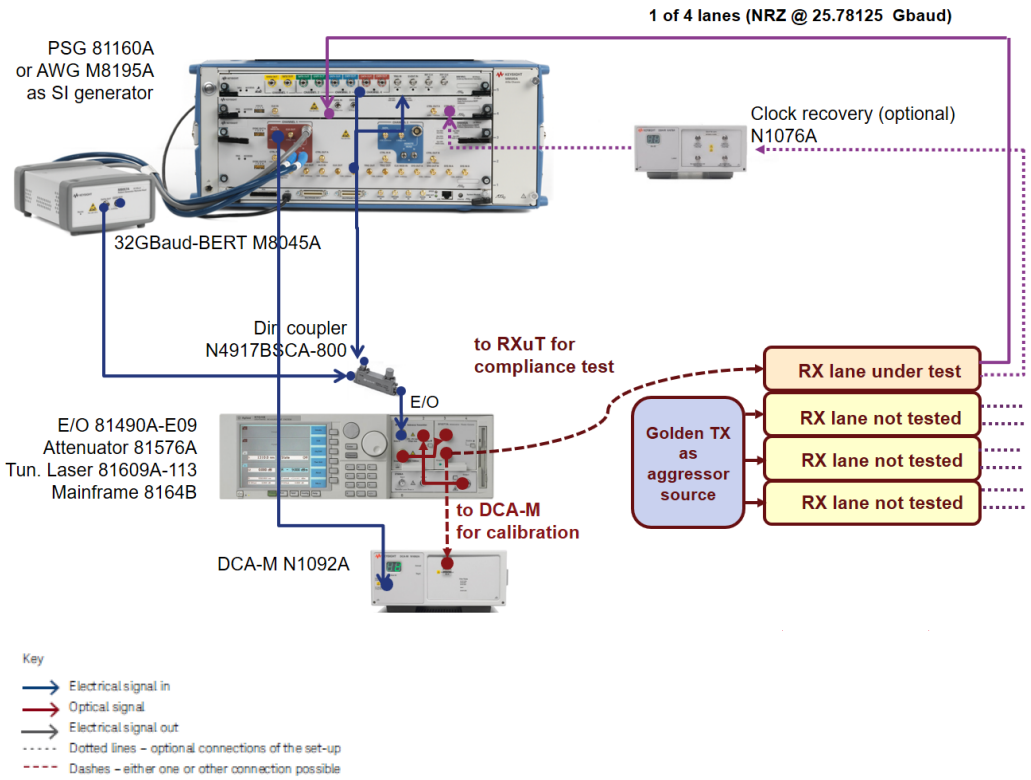

Figure 2. Optical receiver stress test setup for 100 GBASE-LR4/ER4.

100GBASE-LR4/ER4/SR4 Optical Receiver Stressed Test Challenges

The IEEE 802.3 standard, clauses 88.7, 95.7 describe the optical specifications for 100GBASE-LR4, -ER4 and -SR4 optical receivers. The following table contains the salient conditions required for stressed receiver sensitivity test.

	100GBASE-LR4	100GBASE-ER4	CLR4 w/o FEC
Reference Standard	IEEE 802.3-2015 Clause 88	IEEE 802.3-2015 Clause 88	100G-CLR4 MSA Rev 1.5.2 3/22/2015

Aggressor lane OMA	NA	NA	NA

The specified stressed receiver conformance test signal with a given stressed eye closure (SEC) is generated by creating a mixture of the following stress components:

- Inter-symbol interferences (ISI) by means of low-pass filter and frequency response of E/O converter
- 2 sinusoidal jitter sources PJ1 and PJ2
- Sinusoidal amplitude interferer (100 MHz < f_{SI} < 2 GHz, non-harmonic to data signal and other stress components)
- Random jitter

The N4917BACA solution software automatically adjusts the setting of the different equipment to generate the stress signal with the desired characteristics.

Table 1. Applied sinusoidal jitter:

Frequency range	Sinusoidal jitter, peak-to-peak (UI)
f < 100 kHz	Not specified
100 kHz < f ≤ 10 MHz	$5 \times 10^5 / f$
10 MHz < f < 10 LB [1]	0.05

[1] LB = loop bandwidth; upper frequency bound for added sine jitter should be at least 10 times the loop bandwidth of the receiver being tested.

The metrics employed for stress signal calibration are detailed below:

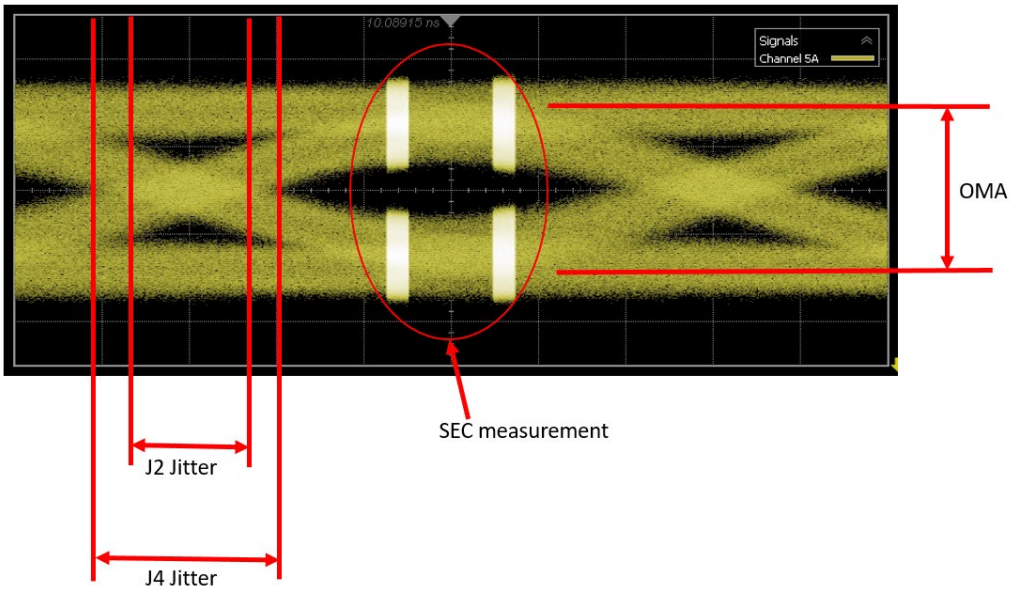

Figure 3. Definition of 100GBASE-SR4 optical stress parameters.

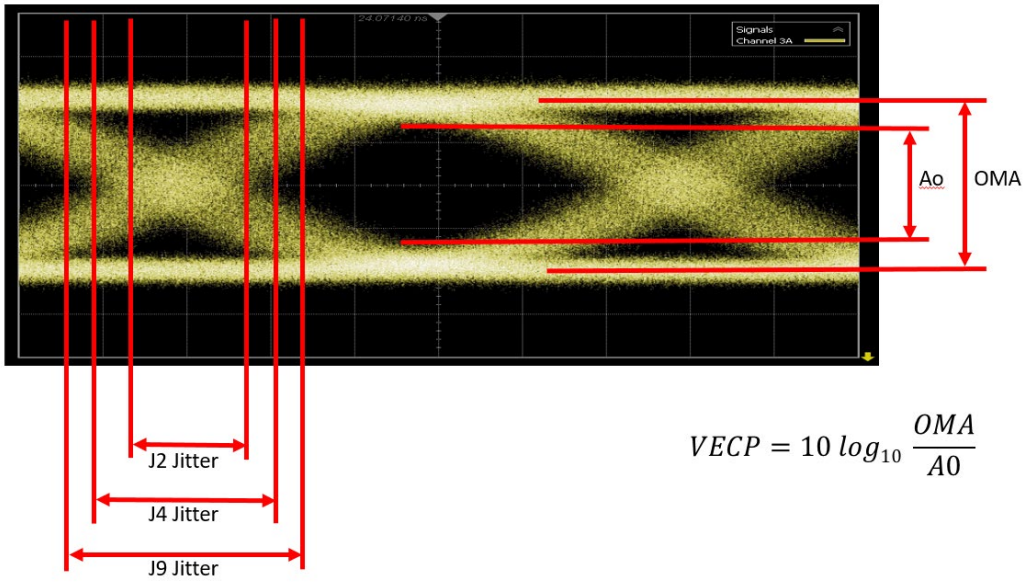
$$SEC = 10\ log10\ \left[\frac{OMA}{2}\ x\ \frac{1}{3.8906 - R}\right]$$ with R as combined noise term of Tx and Ref Rx

BER of 5×10^{-5}



$$VECP = 10\ log_{10}\ \frac{OMA}{A0}$$

Figure 4. Definition of 100GBASE-LR4/ER4 and 100G MSA optical stress parameters.

N4917BACA User Interface

The N4917BACA user interface is structured to follow the generic workflow of an automated test application (Figure 5).

1. **Set Up** tab

   Check connection to instruments (USB, LAN or GPIB connections are supported) and specify the standard to be checked. This step sets the default values for the stress signal metrics and performance targets listed in the **Configure** tab. You can deactivate the connection check of a particular device by selecting ‘not used’ in the corresponding **Channel** or **Slot** field. This lets you use the internal laser of the reference transmitter instead of the tunable laser source or deactivate one of the interference sources.

2. **Select Tests** tab

   Select the actions or tests you want to perform. For example, you can perform a signal calibration, load settings from a previous calibration, measure characteristics of the current optical signal or perform automated performance measurements. These tests are performed one by one in the order they are listed. Additional functionalities, such as optimization of the reference transmitter bias and optical power adjustment, are available.

3. **Configure** tab

   Specify key instrument settings (de-emphasis, max-min voltage, active ports) as well as the target value for the calibration metrics. The **debug** mode enables you to modify the original standard specifications, such as the SEC and ER of the stress signal or the jitter profile to be tested (see Figure 6.). It is also possible to adjust the calibration conditions to your own setup by deactivating the optical power control or accounting for additional loss present in the optical link to the DUT.

4. **Connect** tab

   Displays the hardware connection diagram before the start of a test. This optional step allows the user to check the physical connections between the devices to ensure compliance with the standards.

5. **Run** and **Automate** tabs

   Run the selected tests and measurements or use your own commands sequence implemented with a python script.

6. **HTML Report** and **Results** tabs

   Displays high-level and detailed measurement results. Some tests return a pass/fail value and others return detailed measurement results (e.g. jitter tolerance measurement).

In addition, information about the measurement status, test progress and reports possible errors during the test to the user are listed in the **Messages** tab located on the bottom.

After selecting the optical standard and connecting to all required instruments in the tab, the user selects the measurement tasks and receiver tests to be performed in the **Select Tests** tab. Hence a complete conformance test and characterization would include the following tasks, provided by the N4917BACA software:

- Automatic calibration of the stressed receiver conformance test signal
- Perform a receiver conformance test
- Perform a receiver sensitivity measurement
- Perform a jitter conformance test
- Perform a jitter performance measurement

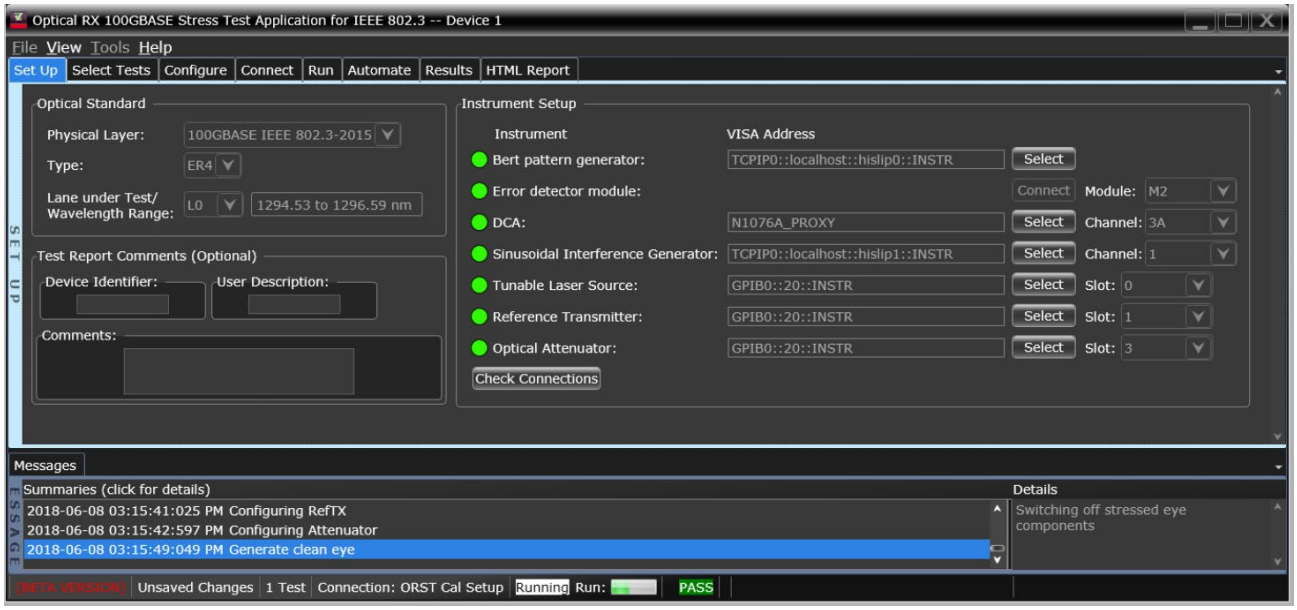


Figure 5. The N4917BACA software Set Up tab is used to connect and check equipment.

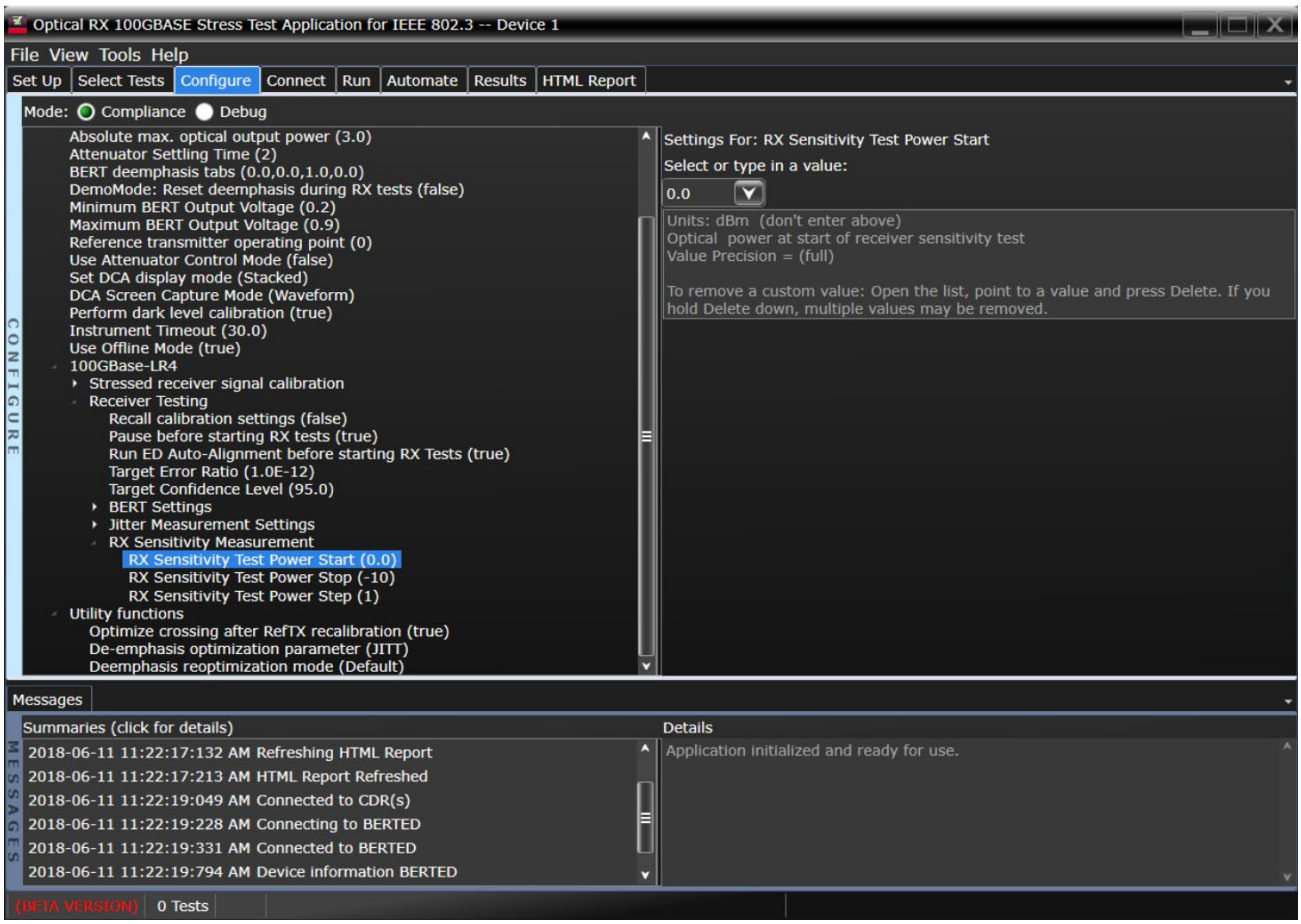

Figure 6. The N4917BACA software **Configure** tab lets the user fine-tune the standard compliant stressed receiver test or adapt to the test to other standards by offering multiple, user-editable settings, such as the stress signal parameters or test conformance limits.

N4917BACA Features

The N4917BACA software creates a stressed NRZ optical waveform from the following setting parameters.

Settable parameters

- Data amplitude (mV pp) [1]
- Sinusoidal interferer amplitude (Vpp) [1]
- Sinusoidal interferer frequency (Hz)
- Periodic jitter 1 and Periodic jitter 2 amplitude (UI)
- Periodic jitter 1 and Periodic jitter 2 frequency (Hz)
- Baud rate (GBd/s)
- Optical power for calibration (dbm)
- OMA for DUT test (dBm) [1]
- Extinction ratio for DUT test (dB) [1]
- Optical wavelength (nm)
- De-emphasis coefficients
- Random jitter amplitude RMS (UI) [1]

[1] These values will be adjusted by the software during the calibration process to meet the calibration parameter targets.

Calibration and measurement parameters

- Extinction ratio (dB)
- VECP, SEC (dB)
- OMA for DUT test (dBm)
- Jitter conformance (pass/fail)
- Jitter performance (UI)
- Stressed receiver sensitivity (BER vs. dBm)
- Eye mask test (mask margin)
- Jitter measurements J2/J4/J9 (acc. Standard definition) (UI)
- Receiver conformance (pass/fail)

N4917BACA Requirements

The N4917BACA software runs on an external PC or on M9537A embedded controller.

PC hardware requirements

- Operating system: Microsoft Windows 7, Windows 8, Windows 10, (64 bit)
- Memory: 8 GB RAM minimum
- Monitor resolution: WXGA+ (1440 x 900) minimum

PC installed software requirements

- Keysight IO Libraries Suite rev. 17.3x or later
- M8070A system software for M8000 Series version 5.0x or M8070B version 6.0x or later
- M8195A soft front panel version 3.0 or M8196A soft front panel version 2.1 if an AWG is used as interference source
- N1010A FlexDCA remote access system A.05.70 or later (if using DCA-M)

PC interfaces

- USB, LAN

Instrument firmware requirements

- M8040A BERT: M8070A/B system software as above
- 81600D DCA-X: FlexDCA version A.05.80 or later
- 8164B LMS: Version V5.25 or later
- 81490A/91A Ref Tx: Version V5.01 or later

Configuration Guide

The N4917BACA optical stress test solution is built up from a variety of instruments. For some of the instruments, alternative selections are supported by the N4917BACA software. Each instrument is an individual order and not part of a bundle. This configuration guide is designed to help you determine the best configuration for your needs.

1. Select the configuration for the M8040A high-performance BERT 64 Gbaud and interference generator

Step 1. BERT chassis configuration	
M8040A	High-performance BERT 64 Gbaud
M8040A-BU2	M9505A 5-slot AXIe chassis with USB option, (requires external PC with USB connection)
Step 2. 1st BERT module minimum required configuration	
M8045A	Pattern generator and clock module 32/64 Gbaud, 3 slot AXIe
M8045A-G32	Pattern generator one channel NRZ, data rate up to 32 Gbaud
M8045A-0G3	Advanced jitter sources for receiver characterization, license
M8045A-0G4	De-emphasis, module-wide license
M8045A-801	Short cable 1.85 mm (m) to 1.85 mm (m), 0.15 m, absolute matching 699 ps ± 1 ps, Qty 2 recommended
M8057A	Remote head for M8045A pattern generator, 1 channel
Step 3. 2nd BERT module minimum required configuration	
M8046A	Analyzer module, 32/64 Gbaud, 1-slot AXIe
M8046A-A32	Analyzer, one channel, data rate up to 32 Gbaud, NRZ
M8046A-801	Cable 2.92 mm (m) to 2.92 mm (m), 0.5 m for clock input, Qty 1 recommended
Step 4. M8000 system software configuration	
M8070B	System software for M8000 Series of BER test solutions
Select one of the M8000 system software license options	
M8070ADVB	Advanced Measurement Package for M8000 Series of BERT Test Solutions (node-locked, transportable, floating or USB license)

Step 5. Interference source minimum required configuration (select one of the listed signal generators for sinusoidal and Gaussian noise interference)	
M8195A	1-, 2- or 4-channel 65 GSa/s arbitrary waveform generator
M8195A-002	2 GSa per module
M8196A	2- or 4-channel 92 GSa/s arbitrary waveform generator
M8196A-002	512 kSa per channel
81160A	1 or 2 Channel Pulse Function Arbitrary Generator
81160A-001	1 Channel 330 MHz Pulse Function Arbitrary Generator
N5171B	EXG X-Series RF Analog Signal Generator, 9 kHz to 6 GHz
N5171B-503	Frequency Range, 9 kHz to 3 GHz
N5172B	EXG X-Series RF Vector Signal Generator, 9 kHz to 6 GHz
N5172B-503	Frequency Range, 9 kHz to 3 GHz

2. Select the configuration for the optical components of the solution

Step 6. Lightwave measurement system mainframe (select one of the lightwave measurement system mainframes)	
8164B	5-slot lightwave measurement system mainframe
Step 7. Tunable laser source configuration (select one of the tunable lasers)	
81602A	Extra high power tunable laser
81602A-013	1250 nm to 1370 nm wavelength range, +17 dBm peak
81606A	Tunable laser family, high power with low SSE
81606A-113	Tunable laser source 1240 nm to 1380 nm, +13 dBm peak
81608A	Tunable laser family, value line, high power low SSE
81608A-113	Tunable laser source 1240 nm to 1380 nm, +13 dBm peak
81609A	Tunable laser family, basic line, high power low SSE
81609A-113	Tunable laser source 1240 nm to 1380 nm, +13 dBm peak
Optical connector interface	
81000NI	Connector interface, FC - narrow key way (1 required)

Step 8. Electrical—optical converter configuration (select one of the single-mode fiber reference transmitters)	
81490A	Reference transmitter
81490A-E09	Ref Tx special with external laser input and internal 1310/1550 nm laser
81490A-E05	Ref Tx special with external laser input and without internal laser
81490A-E10	Reference Transmitter Special with 850nm Laser and up to 26 GHz Electrical Bandwidth
81491A	Reference transmitter
81491A-135	Ref Tx Single Mode with external Input and internal 1310nm / 1550nm Sources
81491A-085	Ref Tx Multimode with internal 850nm Source
81492A	Reference transmitter
81492A-E01	Ref Tx special with external laser input and internal 1310/1550 nm laser
Optical connector interface	
81000FI	FC/PC interface (1 required for -E05, -E09)
81000NI	Connector interface, FC - narrow key way, (1 required for 81490-E05/E10 and 81491A-085, 2 otherwise)
Step 9. Optical attenuator configuration (select one of the single-mode fiber attenuators)	
81576A	Optical attenuator high power, power control, straight SMF
81000FI	FC/PC interface (2 required)
81577A	Optical attenuator high power, power control, angled SMF
81000NI	Connector interface, FC - narrow key way (2 required)
N7761A	Optical attenuator (1 channel), SMF
N7761A-022	Angled connectors
N7762A	Optical attenuator (2 channels), SMF
N7762A-022	Angled connectors
N7764A	Optical attenuator (4 channels), SMF
N7764A-022	Angled connectors
N7751A	Optical attenuator (1 channel) with 2 optical power meter channels, SMF

N7751A-022	Angled connectors
N7752A	Optical attenuator (2 channels) with 2 optical power meter channels, SMF
N7752A-022	Angled connectors
N7766A	Two-Channel Multimode Optical Attenuator
N7766A-050	50/125 um multimode fiber interface
N7768A	Four-Channel Multimode Optical Attenuator
N7768A-050	50/125 um multimode fiber interface

3. Select the configuration for the DCA and N4917BACA software components of the solution

Step 10. Optical/electrical clock recovery (select if clock recovery is required)	
N1077A	Optical/electrical clock recovery
N1077A-232	Supported input rates: 50 MBd to 32 GBd
N1077A-SMS	Internal single-mode (9/125 µm) and multimode (50/125 µm) splitter
Step 11. DCA minimum required configuration (select either a DCA-X mainframe/plugin/time base or a DCA-M model/FlexDCA SW configuration) DCA-X mainframe minimum required configuration	
86100D	Infiniium DCA-X oscilloscope mainframe
86100D-ETR	Enhanced trigger, 13 GHz BW, pattern and module trigger
86100D-PTB	Internal precision timebase
86100D-200	Enhanced jitter analysis SW
86100D-201	Advanced Waveform Analysis Software
86100D-300	Advanced amplitude analysis/Rin/Q-factor
86100D-401	Advanced Eye Analysis Software
DCA-X module. Select one of the DCA-X- modules, minimum required configuration	
86105D	Module, 34 GHz optical/50 GHz electrical, 750-1650 nm SMF/MMF
86105D-281	34 GHz optical/50 GHz electrical hardware
86105D-IRC	Optical channel impulse response measurement/data
86115D	Module, 20/34 GHz optical, 750 to 1650 nm SMF/MMF

86115D-282	Dual input 28 GHz optical sampling module 750-1650 nm for SM and MM fiber
86115D-IRC	Optical channel impulse response measurement/data
DCA-M minimum required configuration (select one DCA-M model)	
N1092A	One optical channel
N1092B	Two optical channels
N1092C	One optical, two electrical channels
N1092D	Four optical channels
N1092E	Two optical, two electrical channels
DCA-M minimum required option configuration	
Option LOJ	Reduce residual jitter from 400 fs to < 200 fs
Option PLK	Pattern lock capability
Option IRC	Extend optical channel bandwidth to 45 GHz and allow creation of reference receiver filters at any data rate from 8 to 42 Gb/s
Option 200	Enhanced jitter analysis, transportable license (can also be ordered as N1010A-200 FlexDCA license)
Option 201	Advanced Waveform Analysis Software, Fixed Perpetual License (can also be ordered as N1010A-201 FlexDCA license)
Option 300	Advanced amplitude analysis/Rin/Q-factor, transportable license (can also be ordered as N1010A-300 FlexDCA license)
Option 401	Advanced Eye Analysis Software, Fixed Perpetual License (can also be ordered as N1010A-401 FlexDCA license)
Option 500	Productivity package, transportable license (Rapid eye, TDEC) (can also be ordered as N1010A-500 FlexDCA license)
N1010A	FlexDCA remote access software
Step 12. N4917BACA optical receiver stress test software configuration	
N4917BACA	Optical receiver stress test for 100G solution software (select one license option)
N4917BACA-1xx	Optical Receiver Stress Test compliance app for 100G IEEE and MSAs, license (node-locked or transportable or floating or USB)

4. Select the accessory components of the solution

Step 13. Select accessories as needed	
N4917B-800	Fiber optic cable, PMF, protected 37 cm narrow key FC/APC (only required for 81490A-E05 or 81490A-E09)
N4917B-803	Patchcord FC/PC-FC/PC connector SM fiber 2 m (choose if using single mode ref Tx)
N4917B-803	Patchcord FC/PC-FC/PC connector SM fiber 2 m (choose only if using O-CDR)
N4917B-804	Patchcord FC/APC narrow key - FC/PC wide key SM fiber 2 m (choose -803 or -804 depending on attenuator connectors)
M8195A-820	Coaxial termination 50 Ω DC to 26.5 GHz, 3.5 mm (male) (for trigger M8045A to M8195, terminate complement output)
11901D	Coaxial adapter 3.5 mm (male) to 2.4 mm (female) (for combing SI and RI)
M8195A-810	Cable, 2.92 mm (m) to 2.92 mm (m), length 0.85 m (for combing SI and RI)
M8195A-810	Matched pair cable, 2.92 mm (m) to 2.92 mm (m), length 0.85 m
N4917BSCA-800	Directional coupler 50 GHz, 13 dB, 2.4 mm (recommended for external interference source RI/SI)
11900A	Coaxial adapter, 2.4 mm (m) to 2.4 mm (m), DC to 50 GHz
N9398F	DC block 50 kHz to 50 GHz, 2.4 mm (male). (For unused M8057A data output)
85138A	Coaxial termination 50 Ω DC to 50 GHz, 2.4 mm (male). (For unused M8057A data output)
11636B	Power splitter DC to 26.5 GHz (choose only if using DCA-X)
83059A	Coaxial adapter 3.5 mm (male) to 3.5 mm (male) (choose only if using DCA-X)
M8195A-810	Matched pair cable, 2.92 mm (m) to 2.92 mm (m), length 0.85 m (choose only if using DCA-X)
82357B	USB/GPIB interface
10833A	GPIB cable, 1 m (choose quantity)
N4917B-805	Patchcord Cable MM-Fiber 50 Micro m 2xFC/PC-wide Key, Length 2m required (choose if the 81490A-E10 or 81491A-085 multimode Ref Tx)

N4917B-806	Patchcord Cable MM-Fiber 50 Micro m FC/APC-narrow Key - FC/PC-wide Key, Length 2m (choose if using the 81490A-E10 or 81491A-085 multimode Ref Tx)
N4917B-801	Cable Assembly coaxial Rg/223 50 Ohm BNC-male to BNC-male (choose if using the 81160A as interference source)
N4917B-802	Adapter-coaxial straight female-BNC male-SMA , (choose if using the 81160A as interference source)
N4917B-808	Adapter, coaxial N-type (m) to BNC (f), (choose if using the N517xB as interference source)

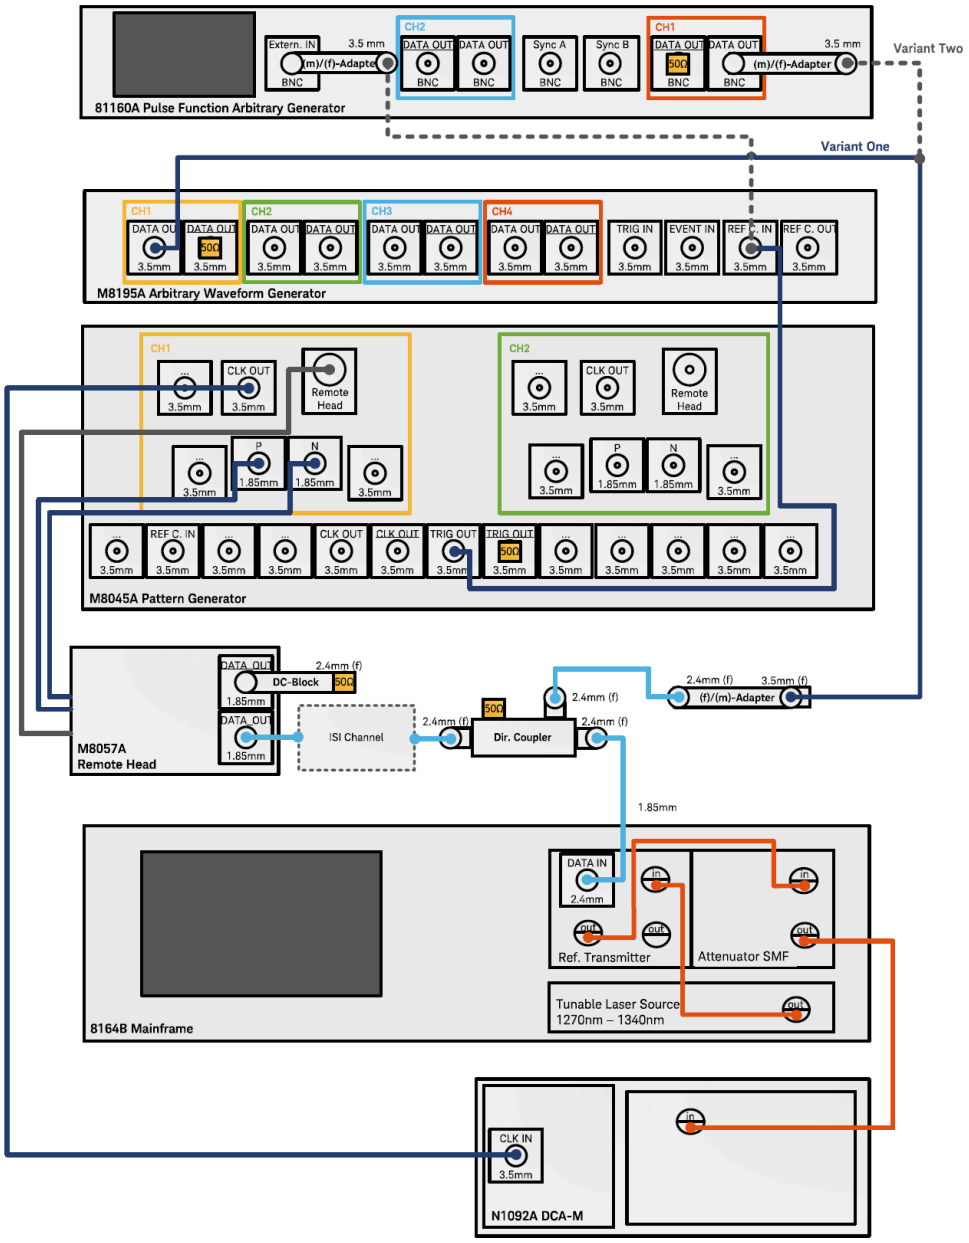

Figure 7. Setup for stressed eye signal calibration for 100 GBASE-ER4/-LR4 and 100G MSAs with clean clock.

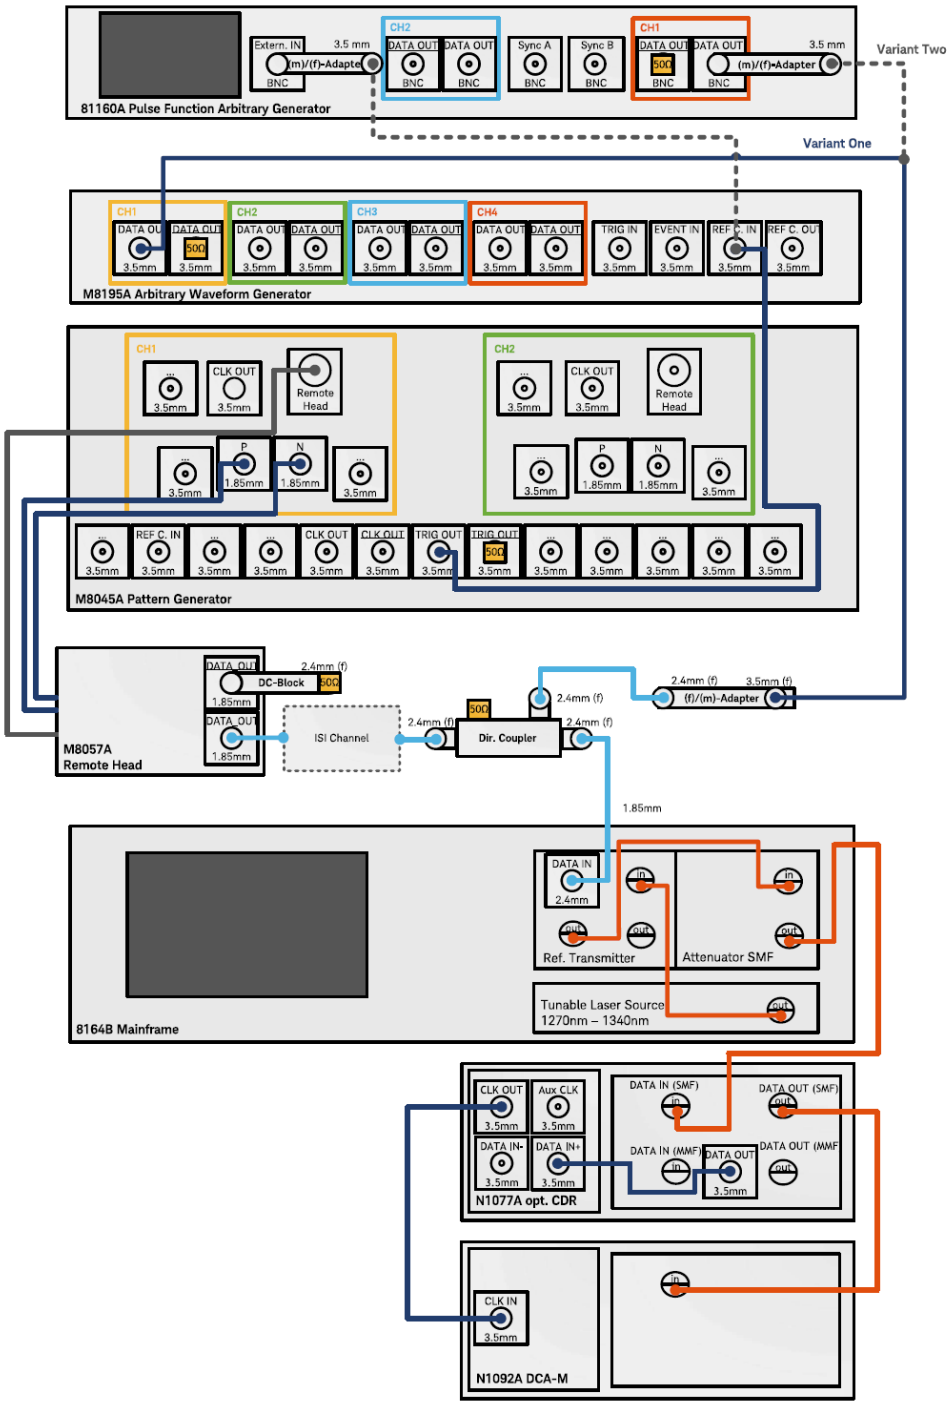

Figure 8. Setup for stressed eye signal calibration for 100 GBASE-ER4/-LR4 and 100G MSAs with recovered clock.

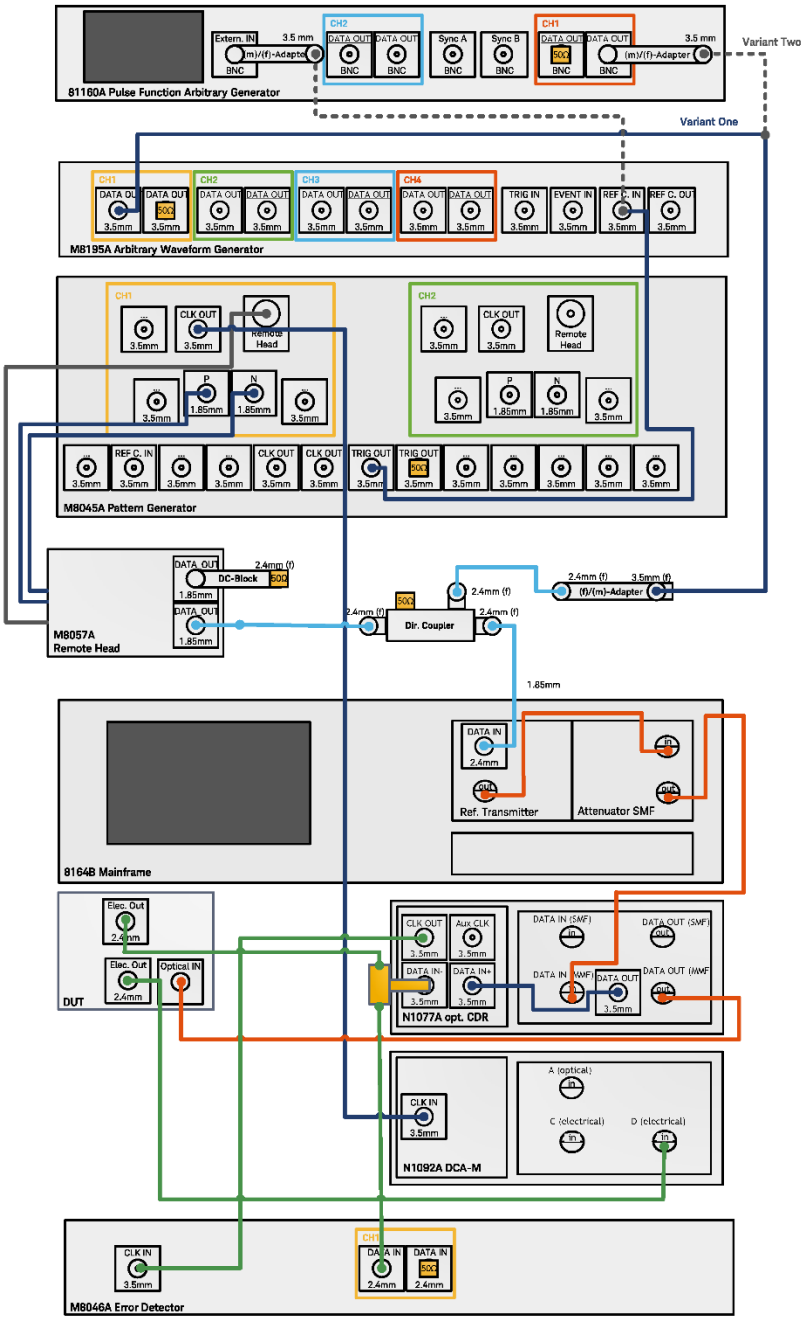

Figure 9. Setup for stressed eye signal calibration for 100 GBASE-SR4 with recovered clock.
