■ DEFINITION OF PARAMETERS

Parameter	Symbol	Unit	Definition
Nominal primary AC current	$I_{PN\ AC}$	Arms	Rated AC current for continuous operation
Nominal primary DC current	$I_{PN\ DC}$	A	Rated DC current for continuous operation
Measuring range	$\hat{I}_{PM}$	A	Max DC current (or peak value) that can be accurately measured
Overload capacity	$\hat{I}_{OL}$	A	Max primary current without damage. Device will be saturated during the overload period.
Nominal secondary current	I_{SN}	mA	Value of the device's output signal when a current of nominal value flows in a conductor placed inside the device's center hole
Primary / secondary ratio	$n1:n2$	none	e.g. 1:1500 means if primary current is 600A, then secondary current (device's output signal) is $600A / 1500 = 0.4A$ or 400mA
Measuring resistance	R_M	Ω	The device's output current must be "closed" to enable the flux compensation. 
Linearity error	ε_L	ppm μA	Maximum deviation or error (in ppm or in absolute μA value) between the output signal of the current transducer at any given point between 0 and $\pm \hat{I}_{PM}$ and the linear regression line obtained from a series of actual output values from $-\hat{I}_{PM}$ to $+\hat{I}_{PM}$ measured at regular current value intervals between these two extremes. 
Offset current (including earth field)	I_{OE}	ppm μA	Value of the device's output signal when there is no primary current in the device's center hole
